

2020 Novo Nordisk New Jersey Half Marathon Beginner Training Plan

The Novo Nordisk New Jersey Half Marathon Beginner training plan is for a runner looking to complete their first half marathon. This plan is well suited for a runner who can currently run 3-4 miles comfortably. The plan is designed to help guide you safely to your first half marathon finish line.

Plan Details:

Length - 16 weeks 3 weekly runs

First Week Mileage - 9.5 Miles : Peak Week Mileage - 23.5 Miles

The Beginner plan is designed for runners looking to complete their first half marathon. The plan is focused on safely building up the runner's mileage to a point where the body is fully prepared for the demands of a 13.1 mile run on race day. There is no single secret to success in training, but with consistent attention to detail and diligent training, you can set yourself up for the best chance of success on race day!

2020 Novo Nordisk New Jersey Half Marathon Beginner Training Plan

Keys to Success:

Long Runs

The long run is the cornerstone of this training plan. In training for the half marathon, your long run will gradually increase from week 1 with a 3.5 mile run to week 15 when you will run 12 miles. The long run in this plan is on Saturday, but you can, if needed, move it to Sunday. The day you don't run each weekend can be used as an additional cross-training day.

Pace

Don't concern yourself with being fast during training. Run all your runs at a comfortable pace. On some days you will feel good and a comfortable pace may be a bit faster, on others your comfortable pace may be a bit slower; that is entirely fine. Listen to your body and run at whatever pace feels good that day. This pace is sometimes called "conversational," meaning you could hold a conversation with someone you were running with. If you are running alone I like to call this pace "sing-along pace," a pace that lets you sing along to your music when your favorite song comes on.

Rest and Recovery

There are rest days built into each week of this plan. It is important that you take your rest days seriously and understand this recipe for success.

Stress + Rest = Growth

In training, the goal is to stress your body and to increase that stress in gradual, small doses, but it is only when we rest and recover that the body can grow stronger.

Racing

Including a couple of shorter races in training prior to the half marathon is a good tool not only for the demands of running but also the excitement and nervousness associated with race morning. This training plan identifies several weekends where it would be valuable to include shorter races into your training. If you can't do a race in that spot, simply run the planned distance as if it were a race.

2020 Novo Nordisk New Jersey Half Marathon Beginner Training Plan

Keys to Success:

Stretching and Mobility

While stretching and mobility is not a built-in part of this training plan, it is a critical component of preventing injury during training. Following every training run, you should plan to stretch for at least 10 minutes. Including frequent foam rolling and stretching sessions into your week outside of your planned training time is also a good idea to help keep you from getting overly stiff and inflexible during your half-marathon training.

Cross/ Strength Training

Cross-training days are included in this training plan. Cross-training is any training other than running that supports your success on race day. A good cross-training session supports running by utilizing and strengthening the often underutilized muscle groups in running. Activities like yoga and light weight lifting can be used to strengthen the runner's core, upper body, and hips.

Hydration and Nutrition

Staying fueled and hydrated is a key component to both training success and race day success. As a general rule of thumb athletes should "drink to thirst." If you are thirsty, sip fluids. Do not guzzle or chug, but taking small sips of fluids regularly as your body craves them will keep you hydrated during your long runs and on race day. It is also a good idea to take in carbohydrates during your longer runs and on race day to support your efforts. While it is not a necessity, many athletes will find that taking in a small amount of carbohydrate in the form of sports gels will benefit their performance.

When training and racing in summer months it is even more important to pay attention to hydration. Be sure to know the signs of dehydration and listen to your body. If you are feeling light headed, dizzy or weak you should stop and seek ways to cool off and replenish your fluids. Always drink fluids following a training run to replace some of what was lost during a hot run.

Race Week

Following your final long run, your training week will be a reduced version of the previous weeks. This portion of the training plan is very important; the goal is to have you feeling fresh, rested, and strong on race day. It is important to have confidence during this point in training. You have done all the hard work, you are ready, do not overdo it now!
